

React HandsOn 12:-

THEORY

Explain about Conditional Rendering in React

Conditional Rendering means displaying different UI elements or components based on a condition. It works like JavaScript conditions (if, else, ternary operator, &&).

Why use Conditional Rendering?

- Show or hide components.
- Display messages based on user login.
- Show loading screens.
- Display data only when available.

Method 1: Using if...else

```
function App() {  
  const isLoggedIn = true;  
  if (isLoggedIn) {  
    return <h1>Welcome User</h1>;  
  } else {  
    return <h1>Please Login</h1>;  
  }  
}
```

export default App;

Output (if isLoggedIn = true):

Welcome User

Method 2: Using Ternary Operator (? :)

```
function App() {  
  const isLoggedIn = false;
```

```
return (  
  <h1>  
    {isLoggedIn ? "Welcome User" : "Please Login"}  
  </h1>  
);  
}
```

Output:

Please Login

Method 3: Using Logical AND (&&)

Used when something should be displayed only if a condition is true.

```
function App() {  
  const isAdmin = true;  
  return (  
    <div>  
      {isAdmin && <h2>Admin Panel</h2>}  
    </div>  
  );  
}
```

If isAdmin = false, nothing is displayed.

Method 4: Returning null

```
function App() {  
  const show = false;  
  if (!show) {  
    return null;  
  }  
  
  return <h1>Hello React</h1>;  
}
```

```
}
```

No output is rendered because null is returned.

Define element variables

An Element Variable is a variable used to store a React element (JSX). It makes conditional rendering easier and improves code readability.

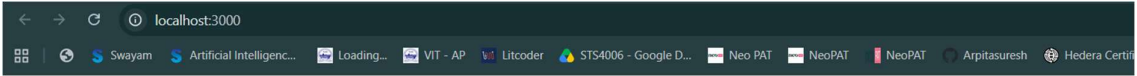

Example

```
function App() {  
  const isLoggedIn = true;  
  
  let message;  
  
  if (isLoggedIn) {  
    message = <h1>Welcome User</h1>;  
  } else {  
    message = <h1>Please Login</h1>;  
  }  
  
  return (  
    <div>  
      {message}  
    </div>  
  );  
}  
  
export default App;
```

Output

Welcome User
